CONTENTS

1. INTRODUCTION ................................................................. 7
2. CHARACTERISTICS OF LONGWALL VENTILATION SYSTEMS ................................................................. 9
   2.1. The U-type ventilation system from the exploitation field borders without ancillary ventilation equipment .................. 10
   2.2. The U-type ventilation system from the exploitation field borders with ancillary ventilation equipment .................. 11
   2.3. The Y-type ventilation system with additional supply of fresh air along the tailgate ................................................ 12
   2.4. The Y-type ventilation system with additional supply of fresh air along the tailgate from the goaves side .................. 13
   2.5. The Y-type ventilation system with bad air distribution in two directions .............................................................. 14
   2.6. Other ventilation systems ................................................. 15
   2.7. The longwall ventilation systems used in the years 2003-2016 .......................................................... 16
3. BASIC INFORMATION ON ENDOGENOUS FIRES .................. 18
   3.1. Factors conducive to the self heating of coal ..................... 21
   3.2. Testing for coal susceptibility to spontaneous combustion ...... 25
   3.3. Analysis of fires in underground mine headings in the years 2003-2016 .......................................................... 28
4. BASIC INFORMATION ON GOAVES WITH CAVING .............. 29
   4.1. Porosity and permeability of goaves with caving ............... 36
   4.2. Analytical equations describing the flow of air stream through a porous medium .................................................. 42
   4.3. Model-based testing of the flow of air stream and mining gases through goaves with caving .................................. 49
5. THE CRITERION ON ENDOGENOUS FIRE HAZARD .......... 57
6. THE GOAVES PERMEABILITY ............................................. 59
7. MODEL-BASED TESTS FOR DETERMINING THE ZONE WITH A PARTICULARLY HIGH RISK OF ENDOGENOUS FIRES IN THE GOAVES OF LONGWALLS .................................................. 61
  7.1. Research methodology .................................................. 62
  7.2. Characteristics of the numerical method .......................... 62
  7.3. Mathematical model of air stream flow and gas transport through a longwall and goaves with caving .................................................. 64
  7.4. Model research for determining the zone with a particularly high risk of endogenous fires in the goaves of longwalls ventilated with the U-type system from the exploitation field borders and with the Y-type system .................................................. 66
      7.4.1. Longwall models .................................................. 67
      7.4.2. Model-based tests concerning the impact of a longwall ventilation system and the type of roof rocks on the location and range of the zone with a particularly high risk of endogenous fires .................................................. 71
  7.5. Model-based tests for determining the zone with a particularly high risk of endogenous fires in the goaves of longwalls ventilated with the the Z-type system, and with H-type system, and with U-type system to the exploitation field borders .......................... 113
  7.6. Summary ........................................................................ 126

8. THE IMPACT VOLUMETRIC FLOW OF VENTILATED AIR STREAM ON LOCATION AND RANGE OF PARTICULARLY HAZARD ZONE OF ENDOGENOUS FIRES IN GOAVES WITH CAVING OF LONGWALL .................................................. 127
  8.1. Test results ...................................................................... 128

9. SUMMARY AND CONCLUSIONS .................................................. 133
   BIBLIOGRAPHY ................................................................. 137
   ABSTRACT ........................................................................ 151
