SIMULATION AND MODELING OF PROCESSES (INCLUDING INDUSTRIAL PROCESSES)

**MODELLING, SIMULATION AND CONTROL OF
PROCESSES**

Dariusz Bismor, Tomasz Grychowski, Karol Jabłoński

Faculty of Automatic Control, Electronics and Computer Science

Ongoing tasks

- Matlab/Simulink simulations and control in teaching:
 - circular evaporator,
 - chemical reactor,
- Control system programming:
 - modelling of discrete plants,
 - programming, tuning and simulation of PID and MPC controllers,
 - object-oriented programming in C++ language,
- Heat pumps and floor systems control
- HVAC systems control
- The Stiliger project

The Stiliger project

- Project objective: design a line of devices for smart buildings
- Ordering institution: Stiliger Sp. z o.o. company, value: 325,000 PLN (part 1) + 195,000 PLN (part 2)
- Team task: design and create software for HVAC systems control, using the Node-RED environment, with implementation in dedicated microcontroller
- Implementation by: designing a building simulator in Matlab/Simulink, creating a GPC algorithm in C++, migration to a microcontroller, *hardware-in-the-loop* tests, and real environment tests in residential building

The Stiliger project

Cooperation:

- Stiliger Sp. z o.o.
- Intelis Sp. z o.o.
- Future Processing Instruments
- Spectrum Krzysztof Czyz

Control of rectification of building objects – RB2

dr hab. inż. Krzysztof Gromysz, prof. PŚ

- Building object rectification consists in placing a system of hydraulic jacks in the walls of the building. Then, with their help, the building is raised unevenly.
- The planned control of rectification will consist in setting the pistons stroke of the jacks, while taking into account the in the value of forces in these jacks.
- The first aim of the research is to identify the parameters describing building during rectification by formulating a mathematical model of the object.
- The next stage of the research is to develop a control method, taking into account the minimization of the necessary power of the hydraulic system and the deformations of the structure elements.

Robotic tools for diagnostics of structures with use of drones, robots and BIM technology - RB6

SIMULATION AND MODELING OF PROCESSES (INCLUDING INDUSTRIAL PROCESSES)

Jacek Pieprzyca

Faculty of Materials Engineering

Laboratory of Modeling Research. There are conducted research in the field of physical modeling and numerical simulation of hydrodynamic phenomena occurring during industrial processes, in particular during smelting, secondary metallurgy and casting of liquid steel. The laboratory is equipped with water physical models of metallurgical reactors and an extensive control and measurement apparatus. Numerical simulations are carried out using the specialized ANSYS Fluent software.

SIMULATION AND MODELING OF PROCESSES (INCLUDING INDUSTRIAL PROCESSES)

Bożena Skołod, Andrzej Sokołowski

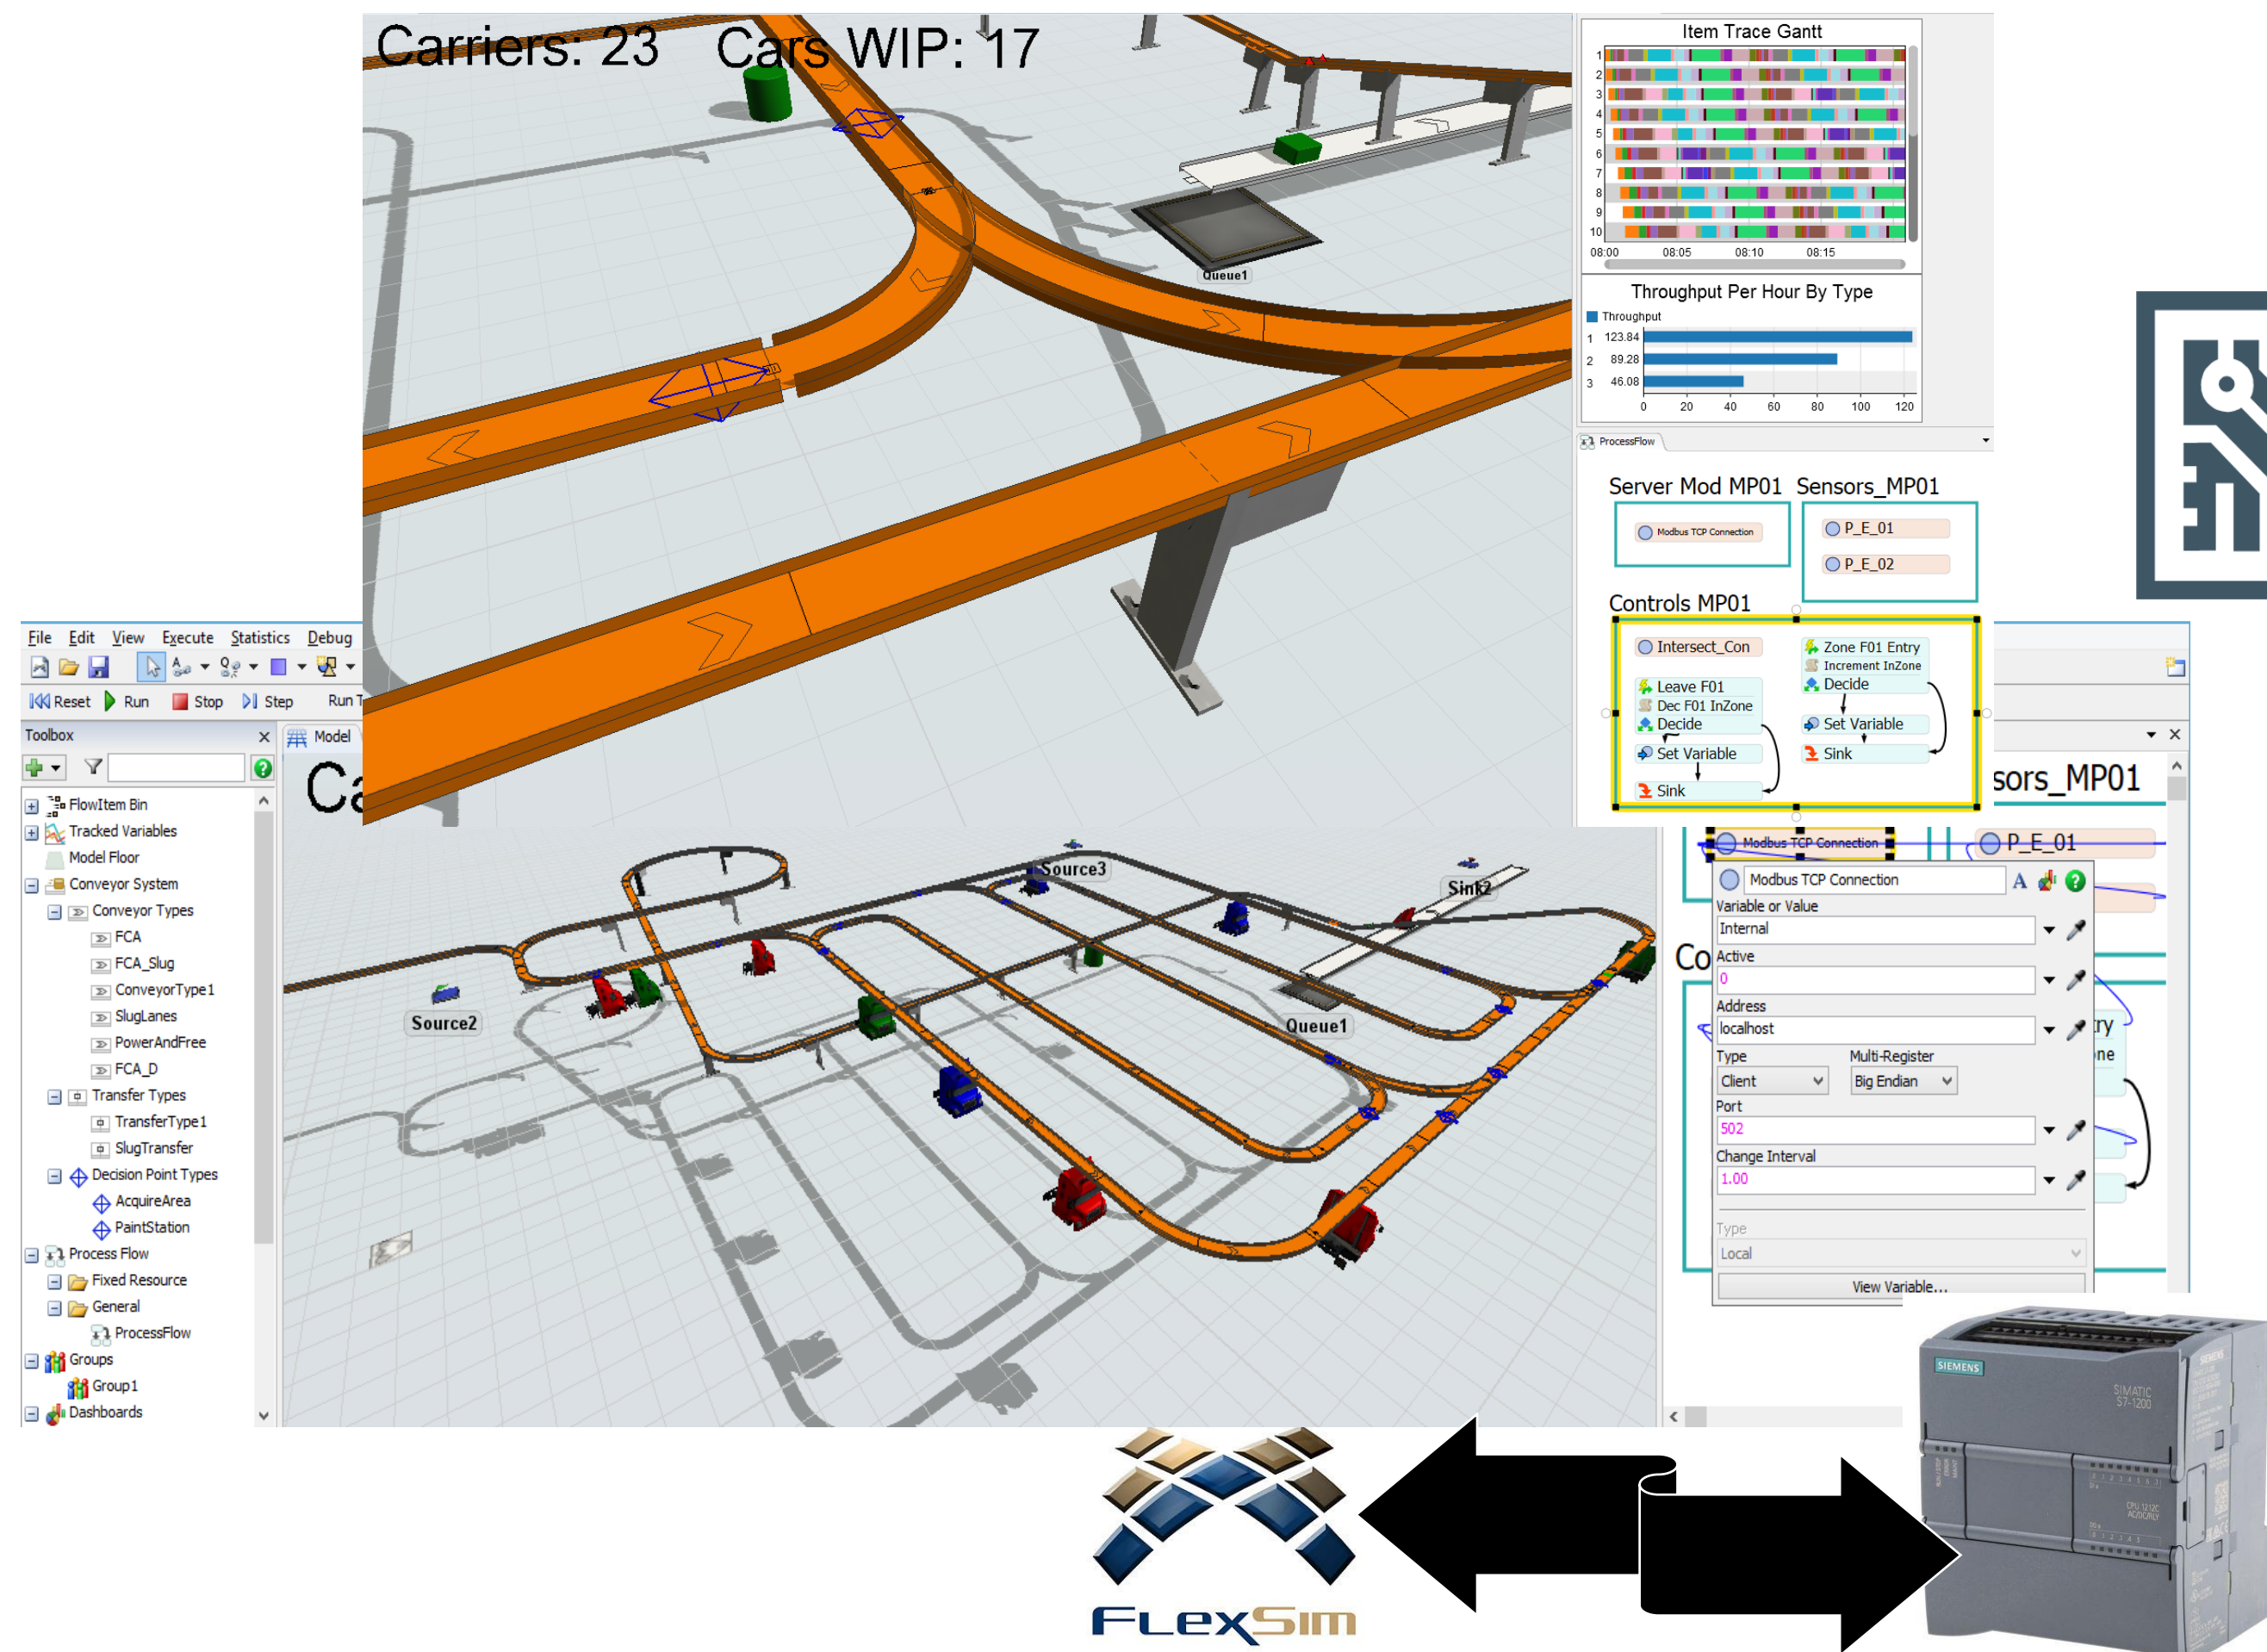

Faculty of Mechanical Engineering

Simulation models as digital twins of production systems based on data from multiple sources

The conducted research activity focuses on the development of automatic generation methods of production system simulation models and the use of computer simulation systems in the implementation of a digital twin. In the context of simulation modeling, these methods allow increasing the level of data integration from the *Digital Model* level, through *Digital Shadow*, to *Digital Twin*. The developed method of creating and updating dynamic simulation models is based on a hybrid parametric approach that integrates data from multiple sources in order to automate the creation and update of simulation models.

CURRENT RESEARCH:

RESEARCH WORKS:

- Analysis and optimization of the production line. Simulation studies.
- Analysis and optimization of the assembly line along with software generators for working time parameters of asynchronous stations. Simulation studies
- Analysis and evaluation of the possibility of introducing a new vehicle type along with adjusting the flow logic in simulation models..

Model of forecasting the cutting jet deflection angle in the AWJM process

The registration of the value of force interactions during the cutting process allows to determine the value of the deflection angle of the abrasive water jet. Knowing the value of the deflection angle makes it possible to control the topography of the surface after cutting.

The method consists in measuring force interactions in real time and the developed mathematical model using selected components of cutting forces to determine the deflection angle of jet by abrasive waterjet method. The cutting waterjet angle directly relates to the deflection of marks after cutting process on the machined surface, i.e. the striation angle.

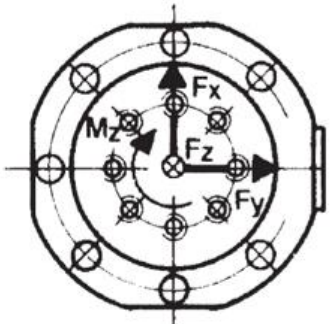

The force measurements were made with a Kistler model 9272 force sensor with a Kistler 5020A piezoelectric amplifier and a PC computer equipped with a NI USB 6211 measurement card.

SIMULATION AND MODELING OF PROCESSES (INCLUDING INDUSTRIAL PROCESSES)

Marcin Szczygieł

Faculty of Electrical Engineering

- **INCREASING THE EFFICIENCY OF THE MINE FLOTATION PROCESS THROUGH THE APPLICATION OF A ROTARY-LINEAR MOTOR**

Project goals:

Research related to increasing the efficiency of the flotation process through new solutions of drive systems

Issues:

- Introduction of the rotational-linear motion of the aerator
- Determination of the control algorithm

Research team:

Department of Mechatronics RE

Department of Electrical Engineering and Automation RGIBiAP

Patents:

Patent - Device for flotation of minerals

Beneficiary:

Coal and metal ore mining companies
