

## SYLLABUS

**Name: Safety engineering in the work environment (PBL)**

**Name in Polish:**

**Name in English:**

### Information on course:

**Course offered by department:** Faculty of Organisation and Management

**Course for department:** Silesian University of Technology

**Study level and form:** Bachelor's degree, Full-time

**Term:** semester 6 (MSCP) 2024/2025

**Coordinator of course edition:**

### Default type of course examination report:

EGZ

### Language:

English

### Course homepage:

<https://platforma.polsl.pl/roz/>

### ECTS

5

### Short description:

The aim of the course is to familiarize students with the basic concepts and essence of safety engineering used in the work environment. Presentation of topics including the functioning of a technical facility in cooperation with humans and the circumstances of threats requiring monitoring. Acquiring the ability to select and construct simple safety systems operating in the work area, understanding the principles of their operation and the principles of operation of their basic elements. Ability to create concepts for work zone security projects using knowledge of safety engineering.

### Description:

Program content:

Lecture: 30 h

1. The essence of occupational safety engineering - basic concepts and connections with other disciplines.
2. The concept of occupational safety engineering in relation to a technical facility.
3. Functioning of a technical facility in the process of its operation by the operator - analysis of the human-machine system.
4. Methodology for constructing a fault tree of a technical object - identification of human and machine errors.
5. Identification of dangerous technical elements and places.
6. Construction of basic work safety systems in the work environment.
7. The use of sensors in occupational safety systems.
8. Application of occupational safety systems in industrial plants - examples.

Laboratory: 15 h

1. Analysis of sensors used in gas safety
2. Work safety engineering in machine movement.
3. Construction of workspace supervision systems at workplaces.
4. Programming workspace security devices using the example of an infrared barrier.
5. Presentation (paper) of a selected occupational safety system from the given topics - group work.

Project: 30 h

1. Phases of designing security systems.
2. Analysis of threats and weak points of the facility
3. Creating a project concept.
4. Creating a security system configuration.
5. Analysis of safety systems in machine traffic.
6. Analysis of weak points and threats in the work zone.
7. Construction of work zone protection systems.
8. Creating a simple design of a safety system operating in the work area - group consultations.

Forms of conducting classes, along with the number of teaching hours:

Lecture: 30 hours

Laboratory: 15h

Project: 30 hours

Number of hours devoted to student's own work:

- preparing a laboratory report: 15/0.5
- project development: 30/1
- exam preparation: 30/1

Number of ECTS points in classes with direct participation of academic teachers or other people conducting classes: 2.5

**Learning outcomes:**

K1A\_W3 the student knows and understands the basic engineering processes and technologies occurring in the life cycle of devices, objects and technical systems, as well as methods of solving typical engineering tasks, in particular in relation to safety engineering in the work environment.

K1A\_W7 the student knows and understands the fundamental problems of modern civilization relevant to management and production engineering, in particular in the area of safety engineering used in the work environment.

K1A\_U7 the student is able to work individually and in a team, taking on various roles, planning and organizing this work, as well as interacting with other people as part of team work (also of an interdisciplinary nature), based on appropriate communication skills using specialized engineering terminology security and modern information and communication technologies, as well as take part in the debate.

K1A\_K1 the student is ready to critically evaluate the knowledge and acquired content in the field of occupational safety engineering, recognize the importance of knowledge in solving cognitive and practical problems, and seek the opinion of experts in the event of difficulties in solving problems independently.

**Assessment methods and assessment criteria:**

Conditions for passing the course: preparing and presenting a report on laboratory classes, completing a written project and passing a written exam on lecture content.

The final grade is 50% of the exam grade (lecture content) and 50% of the average grade from the laboratory and project.

**Practical placement:**
